

Monocode

Junior Full-Stack Developer

monocode779@gmail.com | +213 792 599 625 | monocode.netlify.app | github.com/monocode-dev

SUMMARY

Backend-Specialist full-stack developer with hands-on experience across the stack: React and TypeScript on the front end, Node.js/Express on the back end, and PostgreSQL/SQLite for databases. Independently designed, built, and deployed Projects, Such as a full-stack notes app with authentication and multi-user data isolation — including a live migration from SQLite to PostgreSQL. Comfortable working through unfamiliar problems methodically, reading library source and documentation directly, and debugging production issues independently.

TECHNICAL SKILLS

- **Front-end:** React, TypeScript, HTML, CSS
- **Back-end:** Node.js, Express.js — REST API design, routing, middleware, authentication
- **Databases:** PostgreSQL (migrations, connection pooling), SQLite
- **Auth & Security:** Session-based authentication, bcrypt password hashing, route protection middleware, per-user data isolation, CORS configuration, environment-based config (dotenv)
- **DevOps & Tooling:** Git & GitHub, npm, deployment (Render, Vercel, Neon), VS Code

PROJECTS

Notebook — Full-Stack Notes App (*React, TypeScript, Node.js/Express, PostgreSQL*)

[Live app](#) | [Source code](#)

- Built a full-stack notes app front-to-back: a React front end (components, hooks, controlled forms, lifted state) communicating with an Express and PostgreSQL backend. Features full CRUD, category filtering, session-based authentication with hashed passwords, per-user data isolation, and a responsive UI with mobile drawer navigation.
- Converted the entire codebase from JavaScript to TypeScript (backend and frontend), including typed database rows, typed Express request bodies, a custom express-session type augmentation, and a generic `apiRequest<T>` utility for typed API responses on the client — catching real bugs in the process.
- Migrated the database layer from SQLite to a hosted PostgreSQL database (Neon), rewriting the query layer from a synchronous API to `async/await`, adding a dedicated migration script and a Postgres-backed session store.
- Deployed the app to production (Render for the API, Vercel for the frontend, Neon for the database), resolving real cross-origin issues including CORS configuration and secure cross-site session cookies.

EDUCATION

Self-directed study, full-stack development — ongoing since late 2025

Structured curriculum covering TypeScript, React, Node.js/Express, SQL (SQLite & PostgreSQL), software architecture fundamentals, and independent problem solving.

LANGUAGES

Arabic (native), French (proficient), English (proficient)
